

* Path parameters are dynamic segments of a URL path used to identify a specific resource.

⇒ localhost:8000/view → all patient data

→ localhost:8000/view/3 → Data Params
↓
dynamic

⇒ Path() → function :-

* The Path() function in FastAPI is used to provide metadata, validation rule, and documentation 'hints' for path parameters in your API endpoints.

For example; what we do using path function.

⊙ Title

* Description

* Example: - ge, gt, le, lt, minlength, max-length, regex

⇒ HTTP → Code

⇒ HTTP → Code

2xx → Success

3xx → Redirection → Further need action:-

4xx → Client Error

5xx → Server Error

⇒ 200 → Success

⇒ HTTPException is a special built-in exception in FastAPI used to return custom HTTP error responses when something goes wrong in your API.

↳ Instead of returning a normal JSON or crashing the server, you can gracefully raise an error with:-

- * a proper HTTP status code (like 404, 400, 403, etc)

- * A custom error message

- * (Optional) Extra headers
